

The Energy Saving Window Insulator That Fits All Windows!

Why keep throwing your hard earned money out of the very window that is costing you more to heat or cool your home?

IT'S TRUE!

Windows are the weakest link in any buildings energy performance!

We need windows to provide us with natural light and for us to see out. Even the best single pane or insulated glass windows will not perform to high energy efficiency standards.

Heat always flows to the coldest surface. Since windows are the coldest surface in any building this conduction and convection cooling process is costing you money every hour of every day.

Other window products cover the window cutting out natural light and the ability to see out. Most allow moisture to flow through them, creating condensation on your windows which increases heat loss and leads to other issues such as mold.

Becomes a thermal barrier between the cold window temperature and your room temperature.

Stabilizes inside temperature, which improves overall comfort and reduces heating/cooling costs

In cold climates, the inflector becomes a passive solar heat source for all windows facing the sun

In the summer, you simply reverse the inflector to keep out solar heat & block out up to 70% of harmful UV rays

See through material keep rooms bright by allowing natural light inside

And with several Styles to choose from...we have you covered!

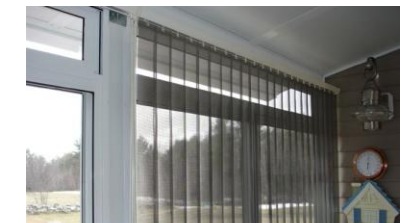

Single Panels

Split Panels

Roller Shades

Vertical Shades

What is the Solarize Inflector Window System?

*The inflector window system is the only window insulation system that is a see-through product and provides more than one feature of energy performance.

IMPROVES THE ENERGY PERFORMANCE IN A SINGLE-PANE GLASS WINDOW BY

70%

IMPROVES THE ENERGY PERFORMANCE IN A THERMOPANE WINDOW BY

40%

The Window Insulators for ALL SEASONS!

Winter Features

*It is a Thermal Barrier between your heated room and the cold window surface, it is a solar collector that will naturally absorb the sun's energy in the winter and provide that free heat into your building.

Summer Features

As a Solar Reflector it will substantially reduce unwanted solar heat gain, reducing cooling costs and making the building comfortable. It also reflects over 70% of the UV from the sun reducing these damaging effects.
